

**ABSTRACT**

5       A vehicle soft top with a main body and  
removable panels. Each panel is at least partially  
received in a conforming cutout section in the main  
body and has a plurality of sides with the upper  
10 side preferably secured to the upper side of the  
cutout section by a pair of interconnecting, sliding  
members. The interconnecting members have mating  
hook portions that can be aligned with one another  
and slid axially relative to each other to hold the  
15 upper sides of the panel and main body together. A  
zipper is preferably used to secure second sides of  
the panel and cutout section together and the  
remaining sides are preferably secured together with  
either belt and channel arrangements or additional  
zippers.
